

SOS-PGE

The SOS-PGE package is great in determining the amount of contamination present in your fuel. This package was designed in accordance with PGE specifications for fuel quality at their facilities. This package covers the particulate contamination level of the fuel as well as water and microbial growth in your fuel.

Test includes the following:

Microbial Growth	ASTM D6469	Sediment & Water	ASTM D2709
Particulate Contamination	ASTM D6217		

Microbial Growth test determines the type and degree of infestation.

Sediment & Water in fuel can cause corrosion, wear, bacterial growth and premature filter clogging.

Particulate Contamination test measures the amount of particulates in fuel by % mass. The mass of particulates that are present in a fuel sample is a significant factor in determining how quickly fuel filters and other areas can become plugged. The greater the mass, the more quickly your fuel filters and other small orifices will become plugged. This will lead to injector failure and ultimately, a breakdown in your engine.
